Project Proposals

Concept 1: Location-information

Description - An application where you can look up a location and find out its weather and view images of the location.

Scope - This application will allow users to search a location. The application will return a page with information about the location, a google map representation of the location, images of the location from unsplash.com and current weather information through WeatherUnderground.com

Features - search function, google map display, images of the location and the current weather of the location.

API - Unsplash API, Google static maps API, Weather underground API.

Concept 2: Game of thrones character Data Base

Description - This application will return information about a game of thrones character to the user through a search function.

Scope - The application will allow the user to search a game of thrones database and return information about that character such as what books they are featured in as well as any other vital information.

Features - search function, character display,

API - An API of Ice and Fire

Concept 3: Shopping list

Description - An Application that will allow the user to create a list of any shopping items they want and have the ability to see the price of the item at Walmart

Scope - Users can create a list and then enter items on the list. Once the item is added to the list pricing is shown next to the item. A running total is kept at the bottom of the list. Users can add and remove items from the list.

Features - Price of items, editable list of items, running total price of items, images of the items.

API - Walmart Product look up API.
